## SECTION I

### INTRODUCTION

#### 1-1. GENERAL

1-2. The quantity of moisture in the air is one of the most important of environmental properties. It affects food, materials, processes and of course human comfort and health. Consequently, the accurate measurement of moisture in the air has been the subject of scientific investigation and over the years many distinctly different measurement techniques have been developed. However, no accurate technique yet developed is quite so convenient and inexpensive as by observing the difference between wet and dry bulb thermometers. Your PSYCHRO-DYNE Model uses the wet and dry bulb method of measuring moisture in the air.

#### 1.3. PRINCIPLES

1-4. The theory of wet and dry bulb thermometers is based on the evaporative cooling effect of the wet bulb. The drier the surrounding air the more rapidly water will evaporate. This causes the wet bulb to depress in temperature until a balance takes place between the cooling effect and the normal heat gain from the ambient condition. The psychrometric formula relates this observed temperature depression and the temperature of the dry bulb to the quantity of moisture in the air. It can express this quantity as relative humidity, absolute humidity, dew point, or vapor pressure.

#### 1-5. REFERENCE CHARTS

1-6. Based on the psychrometric formula, psychrometric charts, tables, and calculators have been devised as a convenience and can be used to rapidly determine any of the above values once the wet and dry bulb temperatures are known. Such tables are contained in the back of this manual.

#### 1-7. THEORY OF OPERATION

1-8. The accurate measurement of the true wet and dry bulb temperatures requires the right equipment and proper precautions, otherwise severe errors can result. First of all, adequate ventilation across the wet bulb is essential for accuracy. Without it a moisture concentration not representative of the ambient conditions will build up around the wet bulb and one will always tend to measure a higher humidity level than what is actually in the air. Ventilation removes the build up and keeps sampling the actual conditions. It has been found by many years of experimentation that 10 feet-per-second or more of air flow is essential for accurate results. Your PSYCHRO-DYNE is designed to provide 15 feet-per-second air flow over the thermometers throughout a reasonably long battery life.

## SECTION II OPERATION INSTRUCTIONS

### 2-1. PREPARATION (See Figure 1)

2-2. To prepare the PSYCHRO-DYNE for operation, proceed as follows:

1. Remove the PSYCHRO-DYNE from the carrying case.
2. Raise the instrument cover and firmly place three batteries (D Size 1.5V) in the instrument with the center (+) contact of each battery facing the back of the instrument.  
**CAUTION:** Placing the batteries in the wrong direction causes reverse air flow.

### 2-3. OPERATION

2-4. To take a reading with the PSYCHRO-DYNE, proceed as follows:

1. Open the instrument cover.

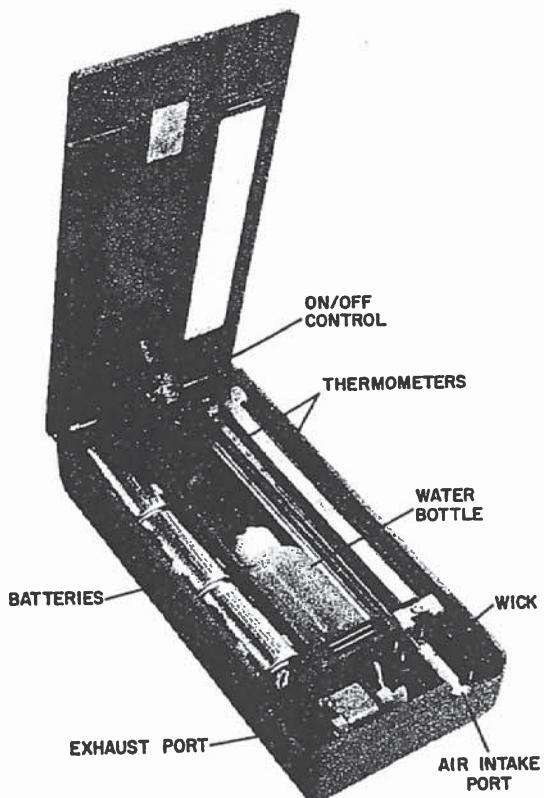

FIGURE 1. PSYCHRO-DYNE

2. Using the distilled water bottle (Figure 1), place the tip of bottle at the wick and saturate with the distilled water.  
CAUTION: Avoid using tap water if possible since this reduces the useful life of the wick. Also when applying the water, avoid splashing or dropping water on the dry bulb.
3. Replace the distilled water bottle and close the instrument cover.
4. Hold or set the instrument in a horizontal plane with the graduations of the thermometers facing the operator.  
NOTE: The air intake and exhaust ports must be entirely free of obstructions. Also, never allow strong light to shine into the intake port. Radiation upon the wet bulb causes evaporation not accounted for in the psychrometric formula.
- 5.1. Slide the fan switch to the "ON" position which starts the fan motor and aspiration.
- 5.2 Slide the lamp switch to the "ON" position which will illuminate the thermometers. Vary the lamp intensity by means of the associated potentiometer.
6. After the fan operates, the wet bulb temperature will begin to rapidly depress. A reading should not be taken until the depression completely stops. This may take from one to two minutes depending on the dryness of the air. If the wet bulb temperature stabilization does not occur within 2½ minutes, the fan motor is probably running too slow due to weak batteries.
7. With the two readings, one may readily determine the relative humidity from the chart on the cover of the instrument or the calculator in the case. For more accurate evaluations, use the set of Tables at the back of the manual.  
CAUTION: Be sure to slide fan switch and lamp switch to "OFF" after each observation.

### SECTION III MAINTENANCE

#### 3-1. SPLIT MERCURY (See Figure 3)

A split or separated mercury (or organic) condition may result if the instrument is dropped. This is noticed by a gap in the mercury column inside the thermometer and will cause erroneous readings. To reunite a separated mercury column, proceed as follows:

1. Raise the instrument cover and hold open by placing water bottle between the rheostat and case bottom.
2. Loosen the bolts that secure the thermometer rubber grommets and turn the retaining clips 90 degrees.
3. With needle nose pliers, carefully grasp the rear grommet of the split column thermometer and lift the thermometer up and gently pull out.
4. A slight separation can usually be reunited by heating the bulb slowly in a soft flame (match) until the separated mercury and the main column both run into the safety chamber at the top of the thermometer bore. Remove the

grommet to allow viewing at the top of the scale. A slight jar will then reunite the mercury.

**CAUTION:** Never completely fill the expansion chamber with fluid as internal pressure will cause breakage. Care should be taken not to heat the thermometer bulb too fast.

If the safety chamber is too small to hold all the separated mercury, it is better to cool the bulb in dry ice until all the mercury runs into the bulb. When using this method apply the dry ice to the bulb but not to the bore. If the mercury freezes solid, it can melt slowly at room temperature without danger of breakage provided it is not frozen in the bore.

5. With the column congealed, replace the grommets so they align with the slots in the frame and set the thermometer gently in position.
6. Insert thermometer by depressing with thumb on grommet until thermometer is fully seated in frame. Failure to do this will cause the cover not to fully close and, create air leaks and provide erroneous readings.
7. Tighten retainers.

### 3-2. PARTS REPLACEMENT (See Figure 3)

1. **STRIKER PLATE.** To replace striker plate, proceed as follows:
  - a. Clean striker plate and area on cover that the plate is to be adhered to.
  - b. Place instrument upside down with the water bottle wedge sideways between the rheostat and case to hold the cover apart from the magnet.
  - c. With Devcon Corporation's "5 MINUTE EPOXY" (follow directions) apply a thin film of epoxy to one side of the plate only.
  - d. Immediately place plate opposite magnetic on cover and allow to cure.
2. **WICKS.** If the wet bulb wick becomes contaminated and is difficult to wet, proceed as follows:
  - a. Remove the wet bulb thermometer (see Para. 3.1).
  - b. Remove the wick and thoroughly clean the bulb.
  - c. Slip 2 inch length of tubular wicking over the bulb with about  $\frac{1}{4}$  inch of material above the top of the bulb onto the stem.
  - d. Secure the wick at the neck of the stem by looping a fine white cotton thread several times around and finally tie a tight square knot.
  - e. Form a loop with a second thread and place it about three-quarters of the way down the bulb and pull toward the bottom. This will stretch the wick tight. When the loop slips over the end tie with a double square knot. Avoid touching the wick as much as possible.
  - f. Replace the thermometer per para. 3-1.
3. **BATTERIES.** The three D cell (1.5 volts) batteries are placed by simply raising the instrument cover and removing the batteries. Only a good grade of leak-proof batteries should be used as replacements. When the instrument is stored for a long period of inactivity, replace the batteries. Always observe proper polarity when replacing.

4. LAMP. To replace the lamp, proceed as follows:
  - a. Raise the instrument cover and completely remove the two bolts, two nuts (located at bottom) and two retainers that secure the thermometer frame.
  - b. Remove the thermometer frame.
  - c. To remove the old lamp, depress and turn counter-clockwise.
  - d. To install a new lamp, reverse the above steps.

## SECTION IV PARTS LIST

### 4-1. GENERAL

4-2. Table 4-1 lists the complete instrument, standard accessories, and optional accessories for the PSYCHRO-DYNE instrument. Table 4-2 lists the detail parts of the PSYCHRO-DYNE instrument.

Table 4-1. Complete Instrument and Accessories (Fig. 2)

INDEX NO.	DESCRIPTION	QTY.	PART NO.
1	PSYCHRO-DYNE	1	
2	Case, Carrying	1	80001
3	Spare Parts Vial, consists of a spare lamp and 2 inches of wick material. (standard)	1	80046
Not Shown	Hanger, Hook (optional)	1	80002
4	Instruction Manual	1	80003
5	Slide Rule, °F or Slide Rule, °C	1	80034
		1	80033

**SECTION V**  
**RELATIVE HUMIDITY AND DEW POINT**  
**TABLES AND CONVERSION FORMULAS**

**5-1. INTRODUCTION**

5-2. Relative Humidity and Dew Point Tables for Fahrenheit temperatures and Relative Humidity Tables for Centigrade temperatures are contained in this section. For computation of Dew Point temperatures for Centigrade . . . observations, use the conversion formula as shown below

**CONVERSION FORMULAS**

Convert  $^{\circ}\text{C}$  to  $^{\circ}\text{F}$  according to the following formula:

$$9/5^{\circ}\text{C} + 32 = ^{\circ}\text{F}$$

Convert  $^{\circ}\text{F}$  to  $^{\circ}\text{C}$  according to the following formula:

$$5/9 (^{\circ}\text{F} - 32) = ^{\circ}\text{C}$$

RECOMMENDED HUMIDITIES AND TEMPERATURES FOR VARIOUS INDUSTRIES					
Industry	Degrees Fahrenheit	Relative Humidity	Hospitals:		
Baking:					
Cake mixing	70-75	65%	Nurseries	75	50-65%
Crackers & biscuits	60-65	50%	Operating room	75	55%
Fermenting	75-80	70-75%	Patient's rooms	As required	40-50%
Flour storage	65-80	50-65%	Laboratories		
Loaf cooling	70	60-70%	Leather		
Make-up room	75-80	65-70%	Chrome tanned	120	45%
Mixer-bread dough	75-80	40-50%	Vegetable tanned	70	75%
Proof box	90-95	80-90%	Storage	50-60	40-60%
Yeast storage	32-45	60-75%	Libraries & Museums	70-80	40-50%
Bowling alleys	70	35-45%	Paint Application:		
Cereal: packaging	75-80	45-50%	Air drying lacquers	70-90	60%
Confectionary:			Air drying oil paint	60-90	60%
Chocolate covering	62-65	50-65%	Paper Products:		
Centers for coating	80-85	40-50%	Binding	70	50-65%
Hard candy	70-80	30-50%	Folding	75	50-65%
Storage	60-68	50-65%	Printing	75-80	45-55%
Data Processing	75	45-55%	Storage	75-80	40-60%
Electrical:			Schools	72	35-50%
Mfg. cotton covered wire	60-80	60-70%	Textiles:		
Storage-general	60-80	35-50%	Cotton-carding	75-80	50-55%
Food:			Cotton-spinning	60-80	50-70%
Apple storage	30-32	75-85%	Cotton-weaving	68-75	85%
Banana-ripening	68	90-95%	Rayon-spinning	80	50-60%
Banana-storage	60	85-90%	Rayon-throwing	70	85%
Citrus fruit-storage	60	85%	Rayon	70	60%
Egg storage	35-55	75-80%	Silk Processing	75-80	65-70%
Grain storage	60	30-45%	Woolens-carding	80-85	65-70%
Meat-beef aging	40	80%	Woolens-spinning	80-85	50-60%
Mushroom storage	32-35	80-85%	Woolens-weaving	80-85	60%
Mushroom-growing stages	Various	60-85%	Tobacco	70-75	55-65%
Produce			Cigar & cigarette	75	70-75%
Sugar	80	70-95%	Other processing & storage	90	88-95%
Tomato-storage	34	30%	Casing room		
Tomato-ripening	70	85%	Woodworking:		
			Finished products	65-70	35-40%
			Gluing	70-75	40-50%
			Manufacture	65-75	35-40%
			Painting-lacquer (static control)	70-90	60% min.
