A

WIND REPORTER INDICATOR  
MODEL 2150  
2151

1.0 INTRODUCTION

1.1 This manual details all the display components of the wind reporting system:

Model 2150 Master Indicator  
Model 2151 Slave Indicator  
M404492 Analog Output Card  
M404493 Dual Input Card

1.2 The system is built around the Model 2150. This master indicator collects data from up to two sensor sites and provides visual display of wind speed and direction from either site, selectable by a front panel switch. Up to three additional dual input cards, M404493, may be added so that eight sensor sites can be monitored by one master. Only one of these sites, however, may be displayed at any given time.

1.3 The system can be expanded with the purchase of a Model 2151 Slave. This indicator operates identically to the master except that it does not collect data. It receives all its' information from the master, but displays the information in any selectable manner independently of the master. Slave indicators may be connected in series.

1.4 The master and slave operate in one of three selectable modes. Instantaneous mode provides one second averages of wind speed and direction updated every 5 seconds. The 2-minute averaging mode indicates average values of speed and direction from the preceding two minutes, along with maximum and minimum speeds and range of direction values over the same period. These values are updated every 5 seconds. The 10-minute averaging mode provides the same data, but with a 10-minute averaging period. A significant change in wind speed and/or direction, based on I.C.A.O. recommendations, causes flashing of indicators on the front panel to alert the observer of these wind conditions. Alarm conditions at non-displayed sites are also indicated on the front display. The I.C.A.O. recommendations along with alarm indications are given in Table 4.0

1.5 The optional M404492 analog output cards allow further system versatility by providing a linear 0 to 1 VDC output

representing a 0 to 200 mph wind speed, and a 0 to 1 VDC output representing 0 to 540° wind direction. These cards may insert into master or slave units according to the rules laid out in Step 3.2. Each analog output card may output an independent mode (instantaneous, 2-min, or 10-min), however the output of all cards in a particular unit represents only the sensor site displayed on the unit's front panel.

## 2.0 SPECIFICATIONS

### 2.1 Input:

Model 2150 ..... 2 channels of speed and direction standard; up to 6 more optional  
Model 2151 ..... output from Model 2150 or other  
Model 2151

Sample interval ..... 5 seconds; all channels  
Display type:

Wind speed ..... 3 ea. red 3-digit LED's for  
average, maximum, and minimum

Wind direction ..... 36 green LED's for average, 36  
yellow LED's for variation range

Display modes ..... instantaneous, 2-minute  
average, and 10-minute average

Indicating range ..... 0 to 200 mph, 0 to 174  
knots, 0 to 89.4 m/s  
or 0 to 322 km/hr  
jumper wire selectable

Resolution:

Wind speed ..... 1 mph, 1 knot, 0.1 m/s,  
or 1 km/hr

Wind direction ..... 10° azimuth

Optional analog output ..... 0 to 1 VDC, wind speed and  
direction; instantaneous, 2-minute  
average, 10-minute average;  
indicated channel only

Power:

Input voltage ..... 110/220 VAC 50/60 Hz,  
switch selectable

Input current ..... 100 mA DC, .25A fuse  
Size ..... 8"W X 8"H X 8"D (203 X 203 X 203 mm)

Weight ..... 9 lbs. max. (4.1 kg)

## 3.0 INSTALLATION

### 3.1 This instrument is thoroughly assembled and inspected at the factory and is ready for installation. Please refer to

the return authorization card included in the packing box if damage has occurred. Also, notify Qualimetrics, Inc.

3.2 Additional Input and Analog Output Cards: The versatility of the wind reporting system is due in part to the customers ability to add or remove dual input cards (M404493) or analog output cards (M404492) to either the master or slave unit. The Model 2150 comes with one M404493 board installed in its 1<sup>st</sup> position (top slot). If additional boards are to be inserted, follow these steps and obey the important rules listed below.

- a) Make sure all power is off.
- b) Remove the two cover screws on the back and slip off the rear enclosure.
- c) Insert board into one of the four slots according to the rules below. (Note that slot positions are referenced as 1<sup>st</sup> for the top position, 2<sup>nd</sup> for the position second from top, 3<sup>rd</sup> for the position third from top, and 4<sup>th</sup> for the bottom or lowermost slot position.)
- d) Push the board in firmly to insure good contact.
- e) Remove the proper amount of covering tape from the rear enclosure.

#### RULES FOR CARDS

- 1) Cards must be inserted component side up.
- 2) Always fill slot positions top to bottom (1<sup>st</sup> through 4<sup>th</sup>) in order.
- 3) Input cards (M404493) are always placed before analog output cards (M404492) in slot position.
- 4) Input cards (M404493) are not allowed in the Model 2151 Slave Indicator.
- 5) Jumpers on each card, M4044932 and M404492, must be inserted as shown in Table 3.0.

3.3 Mounting: The Models 2150 and 2151 mount in a panel with a square cut out to dimensions of 7.65"  $\pm$  0.1". The panel should not be more than 0.25" thick. Remove the two side brackets and insert the rear end of the indicator unit through the square hole. Secure the unit to the panel with the two side brackets.

3.4 Interfacing: Refer to Wiring Diagram 2150-025 for details on connecting sensors to the Model 2150. This diagram also

\* SEE STEP 3.2 FOR OTHER APPLICABLE RULES.

- NOTES:
1. ALL JUMPER COMBINATIONS NOT EXPLICITLY SHOWN ARE INVALID.
  2. BLANKS ARE NON-APPLICABLE TO BOARD OR RESULT.
  3. REFER TO ASSEMBLY FOR JUMPER LOCATIONS.

shows wiring for 2150's that have a combination of M404493 input boards and M404492 analog output boards. To connect a wire to a terminal, simply loosen the screw, insert the stripped wire into the hole directly above, and tighten the screw.

3.5 The Model 2151 will not accept dual input cards, since it obtains all its' information from the master indicator. It will, however, accept up to four M404492 analog output boards. Drawing 2150-025 shows examples of hook up.

3.6 Slave indicators may be connected in series with one another as shown in Drawing Number 2151-025. The communications cable connecting master and slaves may need to be manufactured as shown in the drawing. There is no limit to the number of slave indicators connected in this manner.

3.7 Before connecting a power cord to the power receptacle, make sure the select switch is indicating the correct AC voltage. Turn the unit on with the power switch. Disregard the display for the first few seconds while the unit is in the initialization state.

#### 4.0 THEORY OF OPERATION

4.1 Operation Details: Figure 4.1 shows all front panel controls and indications. A description of each is included.

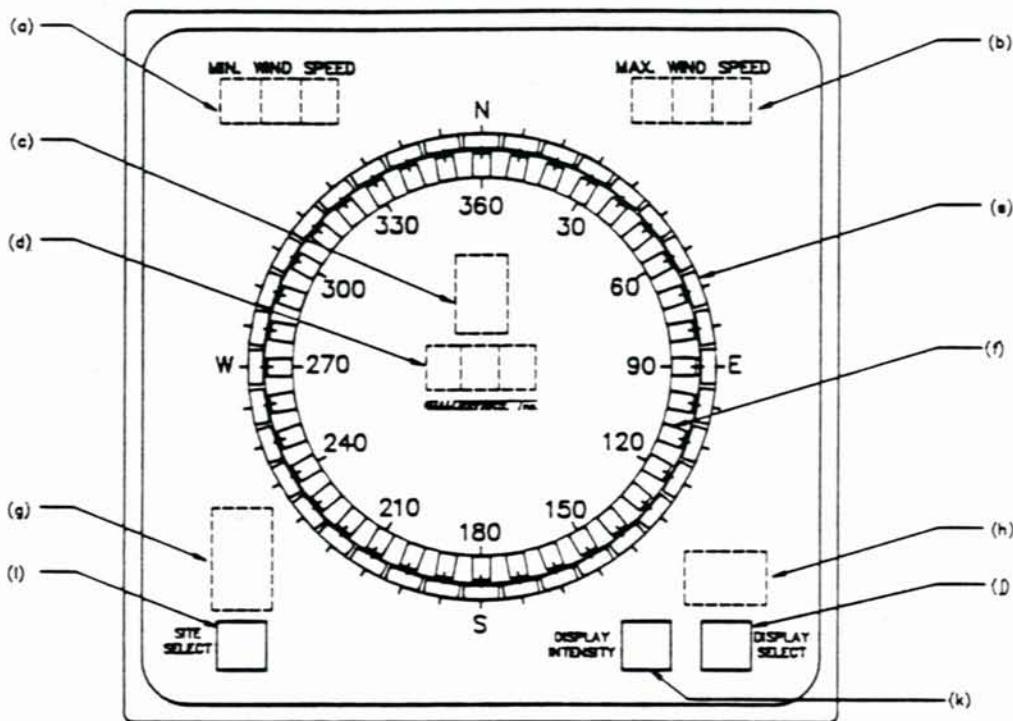

4.2 The master and slave unit operate in one of three distinct modes, selected by depressing the "Display Select" switch on the front panel. The modes of operation are described in Paragraph 1.4 and illustrated in Figures 4.2, 4.3, and 4.4. Mode of operation is indicated directly above the switch.

4.3 The "Display Select" switch may also be used to put the unit into a test pattern that sequentially illuminates all display LEDs. The test pattern is illustrated in Figure 4.5 and should be used to check the condition of all display LEDs.

4.4 The "Site Select" switch may be pressed to select a different sensor site for display. Displayed sensor site is numerically indicated directly above the switch. Changing a sensor site also changes the output of all optional analog output cards (M404492) to reflect the currently displayed site.

4.5 The "Display Intensity" switch changes the brightness of the display to one of eight levels. Depress and hold until display illumination reaches desired level.

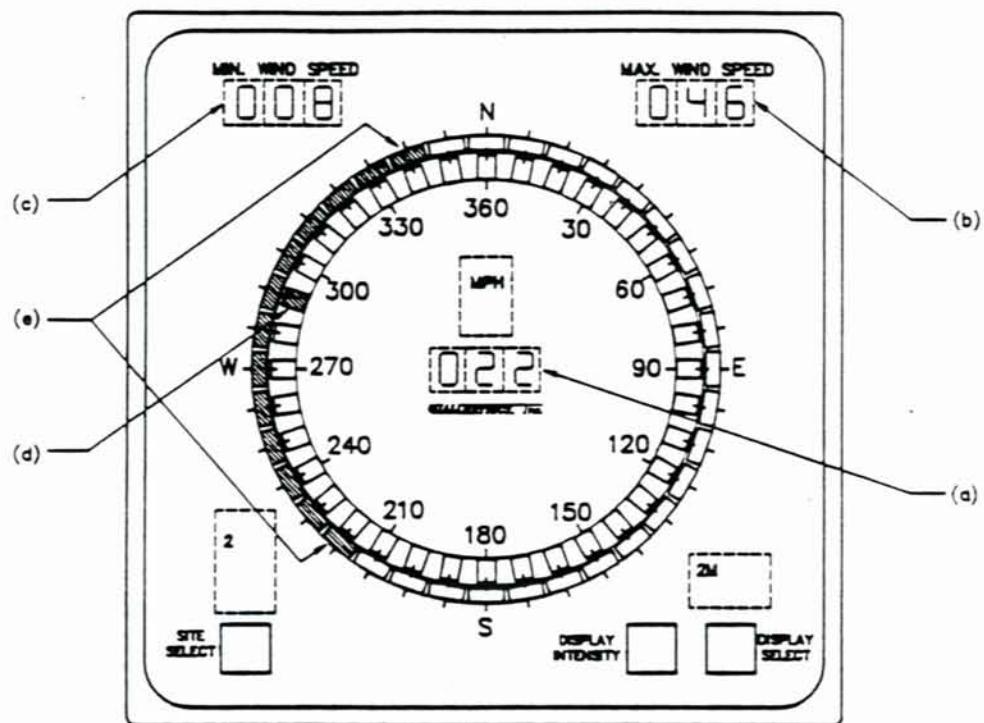

FIGURE 4.1  
FRONT PANEL DISPLAYS AND CONTROLS

LEGEND:

- (a) Minimum wind speed display:
  - minimum wind speed occurring during the previous 2 minutes (2M mode)
  - minimum wind speed occurring during the previous 10 minutes (10M mode)
  - current wind speed based on a 1 second average (INST mode)
- (b) Maximum wind speed display:
  - maximum wind speed occurring during the previous 2 minutes (2M mode)
  - maximum wind speed occurring during the previous 10 minutes (10M mode)
  - current wind speed based on a 1 second average (INST mode)
- (c) Units of measure for wind speed data:
  - M/S = meters per second
  - MPH = miles per hour
  - KTS = knots
  - KM/H = kilometers per hour
- (d) Wind speed display:
  - average wind speed of the previous 2 minutes (2M mode)
  - average wind speed of the previous 10 minutes (10M mode)
  - current wind speed based on a 1 second average (INST mode)
- (e) Wind direction span indicators:
  - range of wind direction during the previous 2 minutes (2M mode)
  - range of wind direction during the previous 10 minutes (10M mode)
  - current wind direction based on a 1 second average (INST mode)
- (f) Wind direction indicators:
  - average wind direction of the previous 2 minutes (2M mode)
  - average wind direction of the previous 10 minutes (10M mode)
  - current wind direction based on a 1 second average (INST mode)
- (g) Indicates sensor site number from which displayed data is gathered.
- (h) Shows the indicator's current mode of operation:
  - 2M = two minute averaging mode
  - 10M = ten minute averaging mode
  - INST = instantaneous mode
  - TST = test pattern
- (i) Selects the sensor site number for display.
- (j) Selects the mode of operation for the indicator, or test pattern for display check.
- (k) Selects one of seven possible brightness levels for the display LED's.

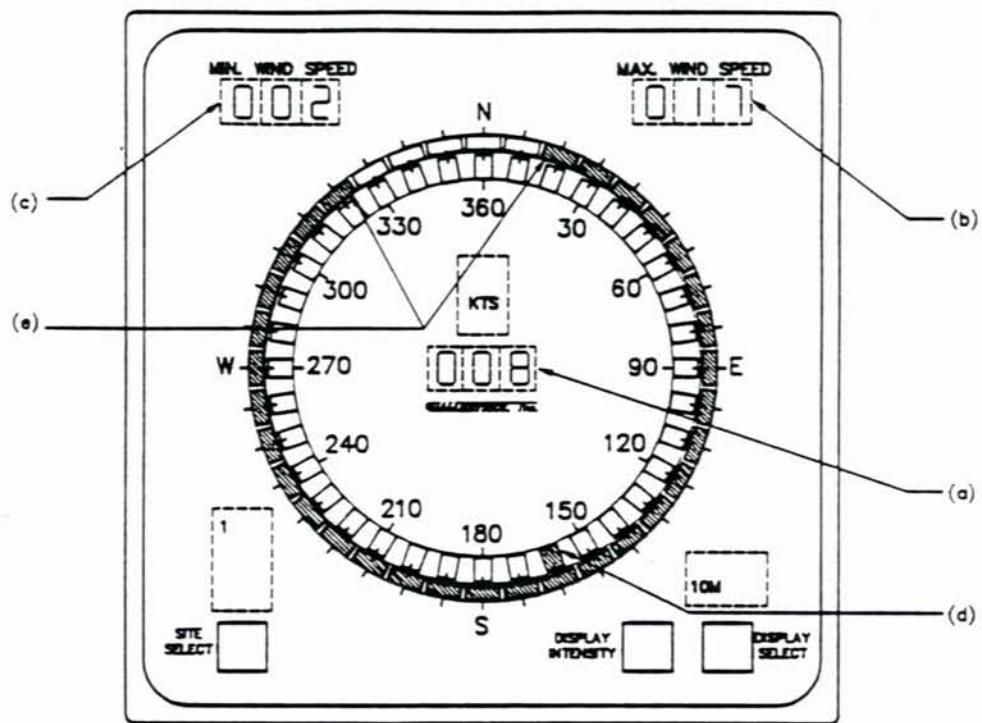

FIGURE 4.2  
TWO MINUTE AVERAGING MODE  
(SAMPLE DISPLAY)

INFORMATION DISPLAYED:

- (a) Wind speed at sensor site #2 averaged 22 miles per hour during the last 2 minutes.
- (b) Maximum wind speed at sensor site #2 was 46 miles per hour over the last 2 minutes.
- (c) Minimum wind speed at sensor site #2 was 8 miles per hour over the last 2 minutes.
- (d) Wind, at sensor site #2, came from an average 290° azimuth direction during the last 2 minutes.
- (e) Wind direction at sensor site #2 varied between 220° and 340° through 270° during the last 2 minutes.

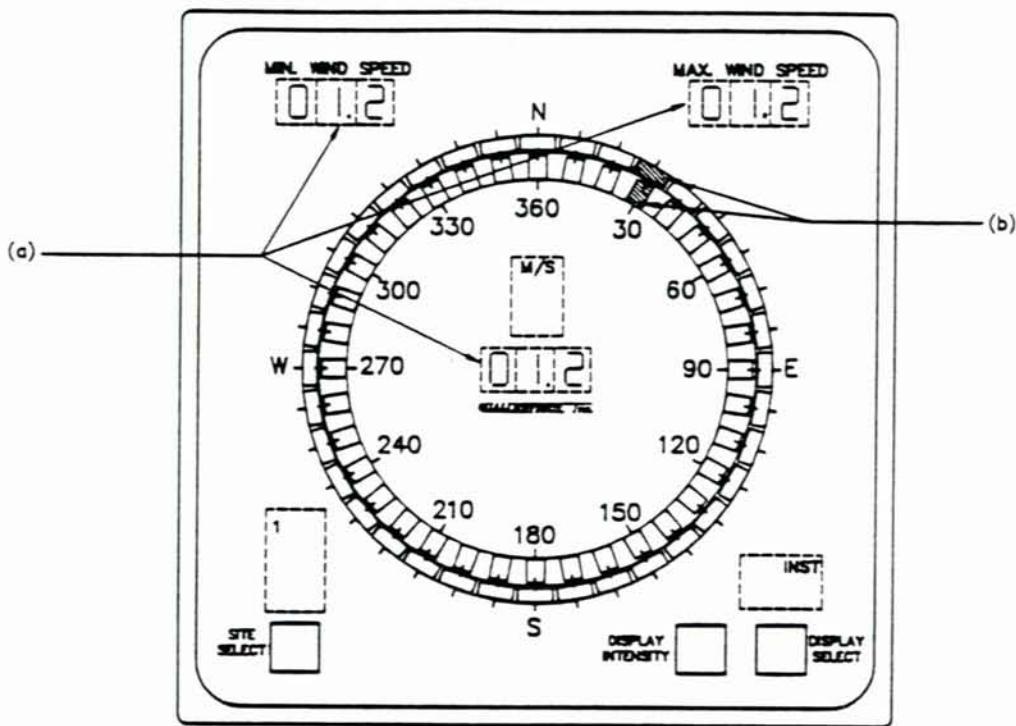

FIGURE 4.3  
TEN MINUTE AVERAGING MODE  
(SAMPLE DISPLAY)

INFORMATION DISPLAYED:

- (a) Wind speed at sensor site #1 averaged 8 knots during the last 10 minutes.
- (b) Maximum wind speed at sensor site #1 was 17 knots during the last 10 minutes.
- (c) Minimum wind speed at sensor site #1 was 2 knots during the last 10 minutes.
- (d) Wind, at sensor site #1, originated from an average 160° azimuth direction during the last 10 minutes.
- (e) Wind direction at sensor site #1 varied between 20° and 320° through 180°, during the last 10 minutes.

FIGURE 4.4  
INSTANTANEOUS MODE  
(SAMPLE DISPLAY)

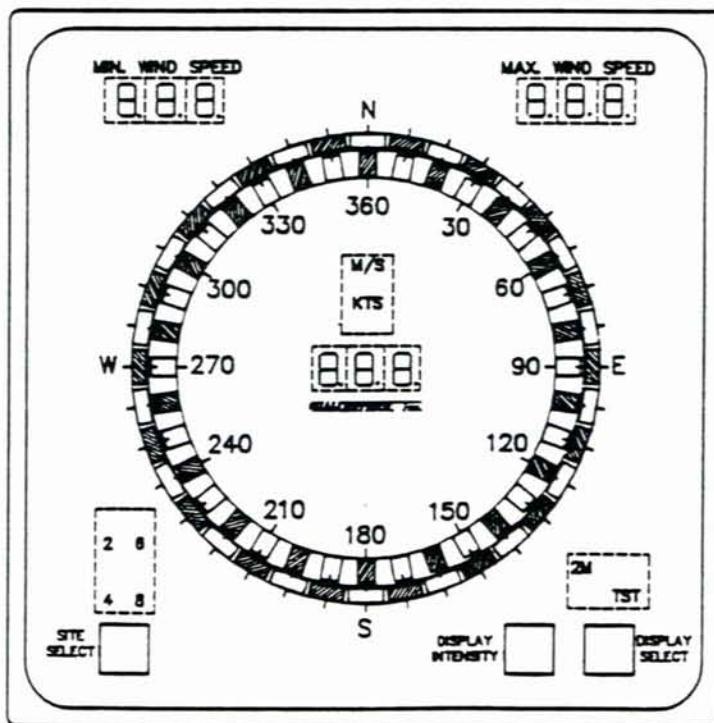

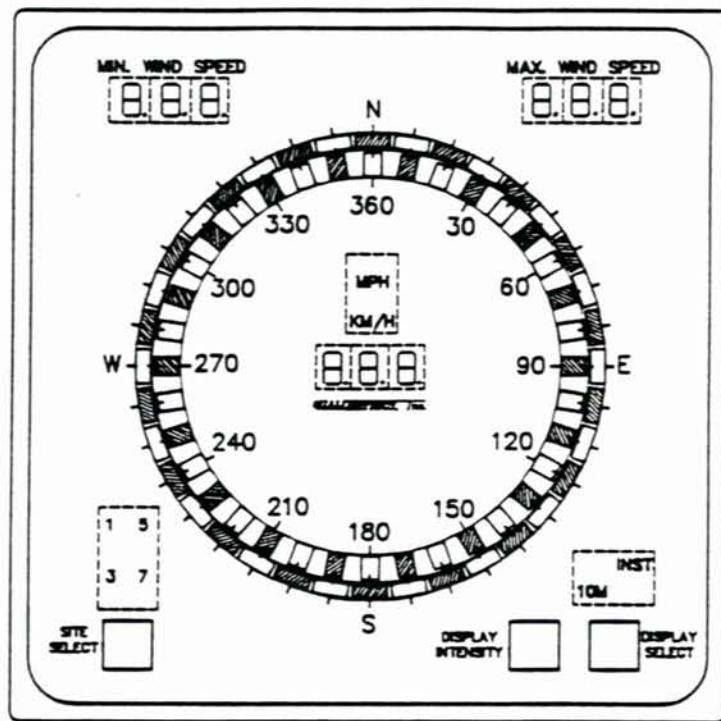

INFORMATION DISPLAYED:

- (a) Wind speed at sensor site #1 is 1.2 meters per second, based on a 1 second average.
- (b) Wind at sensor site #1 is originating from a 30° azimuth direction, based on a 1 second sample.

## FIGURE 4.5 TEST PATTERN

(CONSTANTLY ALTERS BETWEEN THE  
TWO FIGURES SHOWN)

- 4.6 Both master and slave indicators are programmed to indicate alarm and error conditions on the front panel. Table 4.0 describes the alarm conditions based on I.C.A.O. recommendations, while Table 4.1 lists all error messages. Refer to these tables whenever a condition occurs that appears abnormal.
- 4.7 Remember that master and slave units may be operated completely independent of each other. Although all sensors are connected to the master, the slaves receive all data so that different site numbers and different modes of operation can be monitored by the slaves. Also remember that output modes of analog output cards are jumper selected (see Table 3.0), and that this output reflects the sensor being currently displayed on the unit.
- 4.8 Software Description: Both master and slave indicators operate off a program that governs all operations of the wind reporting system. The following paragraphs describe the manner in which data is collected and processed.
- a) Except for specific alarm conditions, wind speed and wind direction are treated as separate entities; all wind speed calculations are performed only with wind speed data and all wind direction calculations are performed only with wind direction data. Therefore, a wind direction indication with zero wind speed is possible.
  - b) Upon power up of the system, the microprocessor executes an initialization routine which includes checking how many and what kind of input and output boards are connected to the unit. It then proceeds to enter an infinite loop that performs the following routines every 5 seconds: data collection routine, calculation routine, alarm routine, display routine, and output routine.
  - c) The data collection routine begins by allowing the frequencies representing wind speed and direction to trigger a counter for precisely one second, so that the count digitally represents the two parameters. Wind speed is read first. An offset is subtracted so that actual wind speed in miles per hour is stored. The data is checked for validity and rounded to 0 or 200 mph if a 1.5% or less out of bounds error is encountered. If the data exceeds the bounds limits, an error flag is set. Wind direction is then read from the counter and stored as degrees. If the data is 0.83% or less out of range ( $3^\circ$  out of  $360^\circ$ ), the values are rounded to the lower or upper limits; greater errors force an error flag on direction. If 4 consecutive errors are found for speed or direction, the storage arrays for the

TABLE 4.O

ALARM CONDITIONS BASED ON I.C.A.O. RECOMMENDATIONS

| DISPLAY SYMPTOM                                 | SIGNIFICANCE   |
|---|--|
| Flashing minimum and maximum wind speed display | Warns that the wind speed situation in paragraph 4.5.6 below has been met or exceeded. Flashing begins whenever the latest 1 second sample of wind speed differs by 10 knots or more from the 10 minute mean, and persists for one minute thereafter. Units mode of operation dictates the significance of values displayed.   |
| Flashing wind direction span indicators         | Signals that the wind direction situation in paragraph 4.5.6 below has been met or exceeded. If the current 1 second sample of wind direction differs from the 10 minute average by 60° or greater, and if the current and average wind speed over the 10 minutes is greater than 5 knots, then flashing begins and persists for one minute thereafter. Significance of indicated span is governed by the units mode of operation. |
| Blinking sensor site numbers                    | Indicates that one or both of the conditions in paragraph 4.5.6 below has been met or exceeded at the particular non-displayed site. Switch display to the blinking site for indication of parameter exceeded. Site numbers remain blinking for one minute after the last alarm condition has been exceeded at the non-displayed site.   |

The following paragraph is taken from:

Meteorological Service for International  
Air Navigation, International Civil Aviation  
Organization, Annex 3, 9th edition, 1983.

4.5.6. RECOMMENDATION - IN REPORTS FOR TAKE-OFF AND LANDING, VARIATIONS IN THE WIND DIRECTION SHOULD BE GIVEN WHEN THE TOTAL VARIATION IS 60 DEGREES OR MORE WITH MEAN SPEEDS ABOVE 5 KNOTS; SUCH DIRECTIONAL VARIATIONS SHOULD BE EXPRESSED AS THE TWO EXTREME DIRECTIONS BETWEEN WHICH THE WIND HAS VARIED DURING THE PAST TEN MINUTES. VARIATIONS FROM THE MEAN WIND SPEED (GUSTS) DURING THE PAST 10 MINUTES SHOULD BE REPORTED ONLY WHEN THE VARIATION FROM THE MEAN SPEED HAS EXCEEDED 10 KNOTS; SUCH SPEED VARIATIONS (GUSTS) SHOULD BE EXPRESSED AS THE MAXIMUM AND MINIMUM SPEEDS ATTAINED. IN REPORTS FOR TAKE-OFF, SURFACE WINDS OF 5 KNOTS OR LESS SHOULD INCLUDE A RANGE OF WIND DIRECTIONS, WHENEVER POSSIBLE.

TABLE 4.1 ERROR CONDITIONS

| DISPLAY SYMPTOM   | SIGNIFICANCE   | REMEDY   |
|---|--|--|
| All four wind speed indicators illuminated  | Display is not yet stable following a site or display select.  | Wait a few seconds for stabilization.  |
| All decimal points lit  | Not enough data points have been collected to perform wind speed calculations in 2M or 10M mode. Indicated values are based on data collected thus far.                    | Following initialization or reset, let an entire sample period for a chosen operation mode expire before considering wind speed calculations valid.  |
| Three consecutive wind direction indicators lit   | Not enough data points have been collected for a 2M or 10M average of wind direction. Illuminated center LED represents average wind direction of data collected thus far. | Following initialization or reset, allow an entire sample period to pass before considering average wind direction valid in 2M or 10M mode.  |
| "Checker board" pattern exists on all wind direction and wind direction span indicators | Bad wind direction data exists.  | Allow a 1/2 hour warm up period for the model 21501 electronics at sensor site. Make sure slaves are connected to master correctly. If problem persists, check calibration of model 21501. |
| Speed indicators consecutively output "E.E." "E.E.4."                                   | On master Indicator - wind speeds in excess of 200mph or lower than 0mph are being detected.<br>On slave Indicator - data is not being received from master.               | Allow a 1/2 hour warm up period for the model 21501 electronics at sensor site. Make sure slaves are connected to master correctly. If problem persists, check calibration of model 21501. |
| Speed indicators read "E.E.1."  | No dual channel input card exists in first slot of master Indicator.   | Install a M404493 card according to procedures and rules outlined in step 3.2 of "Installation" section.   |
| Speed indicators read "E.E.2."  | A dual channel input card follows an analog output card in the master Indicator.   | Install M404492's and M404493's in accordance to procedures and rules outlined in step 3.2 of "Installation" section.  |
| Speed indicators read "E.E.3."  | A blank position is detected between input and/or output cards. Step 3.2 rule 2 is violated.   | Install M404492's and M404493's in accordance to procedures and rules outlined in step 3.2 of "Installation" section.  |

particular site are reset and an error message is sent to the display (see Table 4.1).

- d) The calculation routine is then called to find the minimum, maximum, and average of the valid data stored in the arrays. Wind direction averaging is done vectorially assuming a unity magnitude. Data sets for two and ten minute time intervals are calculated for direction and speed for every valid channel.
- e) The alarm routines are called which set alarm flags for a given channel if that channel meets or exceeds the criteria outlined in Table 4.0.
- f) Next, the display routines call upon the output display drivers to output the selected information onto the face of the unit. At this time, wind speed is converted to jumper selected alternate units according to the formulas:

$$\text{Knots} = \text{mph} * 0.86897624$$

$$\text{Meters per second} = \text{mph} * 0.44704$$

$$\text{Kilometers per hour} = \text{mph} * 1.609344$$

The direction span calculation steps through the values that are stored in the direction array (if 2 or 10 minute modes are selected) and illuminates LEDs accordingly. The algorithm calculates the shortest span between any two direction values, taking into account the wrap around of 0 to 360 and 360 to 0 degrees.

- g) Finally, the output routine is called to send data serially to the slave units through the communications port. Speed and direction each require 2 bytes for channel identification and parameter value.
- h) Note that the only difference between master and slave units is the manner in which they obtain their speed and direction information. The master reads the value from the counter on the input board and determines site number from which counter is read. The slave obtains its' site number, wind speed, and wind direction in digital form from the master. In this way, each unit performs all data manipulation individually so that the units may operate independently of one another.
- i) The software is written so that wind speed and direction for the displayed site number are delivered digitally to the analog output card, if such a card is identified. A jumper on the particular card determines whether instantaneous, 2-minute average, or 10-minute average values will be appear. The D/A convertor yields

a 0-1 VDC output over the wind speed range, and a 0-1 VDC output corresponding to 0-540° direction. The idea behind the 540° indicator is shown in Table 4.2. Basically, directions between 0° - 180° through east can be represented by two different output voltages. Directions between 0° - 180° through west are represented by only one output voltage. This direction output prevents "painting" of a graph display with winds fluctuating around north.

- 4.9      Circuit Description: Identical circuitry is contained in both Model 2150 and 2151, except that the Model 2150 contains one or more dual channel input boards, M404493. The three main boards are identified as follows:

|                |   |
|----------------|---|

| Analog output board: | Schematic M404492-004<br>Assembly M404492-003 |

The power supply for the entire system is illustrated as:

|                     |   |
|---------------------|---|
| Power supply board: | Schematic M404491-004<br>Assembly M404491-003 |
|---------------------|---|

The system configuration is shown in Drawing Number 2150-009. The discussion is arranged from input to output.

- 4.10      Dual Input Board:

- a) The mixed waveform containing wind speed and direction information from the sensor site enters at J1 and J2. (The signal from an additional sensor would enter at J3 and J4, but since both signals follow similar paths only the first will be discussed here.) T1 is matched by R2 so that the signal at pins 3 and 4 of T1 is identical to the signal at pins 3 and 4 of the transformer in the Model 21501 electronics package. The amplification stage following T1 adjusts the level of the signal to meet minimum requirements for U1. U1 separates the signal into its upper and lower

TABLE 4.2  
540° WIND DIRECTION OUTPUT  
FROM ANALOG OUTPUT BOARD

components so that the frequency at pin 1 of U1 represents the wind speed and the frequency at pin 10 represents wind direction.

- b) These frequencies toggle the dual programmable counters of U6 while the GATE is low for one second during each five second sample period (see 4.12d for a description of this timing circuit). Both counters of U6 will count down from an "FFFF" value. After the GATE rises, the data on the counters are read according to the codes on address lines A0-A6, assuming the IO/M line is high. A7 must remain low since I/O ports with this bit high are reserved for outputting (see 4.11b). The initialization routine in software determines how many input cards must be read.
- c) Jumper W5 is a hard wired connection that supplies power to the Model 21501 electronics package at sensor site. The DC level at J1 is raised to V+, which is tapped off the output of the rectifier on the power supply board. Jumper W6 should NEVER be connected, since it will short the DC of the power supply board to ground.

#### 4.11 C.P.U. Board:

- a) This board controls all operations of the wind reporter. U9 is the NSC800 8-bit microprocessor with 16 address lines. The speed of the processor is set by the crystal, Y1. The 32Kbyte EPROM, U5, contains the program, while the 8Kbyte RAM chips, U1 and U4, provide the support memory. The memory can only be accessed if the I/O line (IO/M) is low, while the highest address bits, A13-A15, determine which memory chip is accessed according to logic dictated by U12 and U10.
- b) With a high I/O line, memory is disabled and I/O ports are called. The eight lower address bits define an I/O port and are reserved as follows:

80-87 for wind direction, mode, site # indication  
88-8F for direction span indicators  
90-97 for max/min wind speed displays  
98-9F for average wind speed display

Writing to any of these ports will deliver data to the corresponding driver on the driver board.

- c) Writing to port A0-AF enables the UART, U6, and at the same time disables U3 which forces dedication of the data bus to the UART. The UART is programmed to send data serially at 1200 baud. On master units, W1 is inserted so that serial data is sent through U8 and out the communication port every five seconds. For slave

units, W1 is removed and W2 is inserted so that incoming serial data can be received by the UART and sent to the microprocessor. In addition, the data gets re-routed out through the communications port so that other slaves connected in series obtain the data at the same time.

- d) The circuit at the lower right of the schematic is used for brightness control for LEDs. When the display intensity switch is closed, U17 begins counting upward under the pulses sent by U11. As the bits of U17 match the bits of U13, U16 sends an inverted pulse out DIM CLR. DIM SET pulses are generated on a continual basis, since the timer is constantly clocking U13.

#### 4.12 Driver Board (also Display Board):

- a) As DIM SET and DIM CLR pulses are generated on the C.P.U. board, U18 adjusts the width of its output pulse to vary the shut down time of all decoder/drivers. LED illumination decreases as pulse width decreases.
- b) The SHUT DOWN line on select decoder/drivers are also controlled by the outputs of U10. Whenever certain data codes are written to I/O port B0, high Levels are input to U10 from U9. As these levels are "and"ed with a 1 Hz signal from U13, the appropriate decoder/driver turns on and off to indicate alarm conditions.
- c) U13 also times the five second sample intervals. Q0, Q1, and Q2 from U13 can be read from the data lines D0-D3 to indicate sample interval expiration.
- d) U8 is timed with the combination oscillator and counter comprised of U16 and U15. This combination plus U18 also lowers the GATE line to the dual input cards for a precise one second period. At the same time, a low can be read from D7 while the second counter of U15 is clocked again.
- e) Other inputs that can be placed on the data bus include the wind speed units on D3 and D4, site select switch on D5, and display select switch on D6.
- f) All remaining components serve to decode and drive the LED's and display segments on the dispLay board.

#### 4.13 Analog Output Board:

- a) During the initialization routine, the microprocessor reads the code on U4 which tells it that an analog output card exists and what calculation mode it wishes to receive. At output time, the data is written to the

D/A chips, U3 and U6, in the order determined by the address lines.

- b) A negative reference on each D/A can be varied for span adjustments, while zeroing is done by adjusting the offset provided by U5. U5 also serves to invert the signal so that the output varies with positive slope.

#### 4.14 Power Supply Board:

- a) Incoming AC power is applied either in series or parallel with the two primary coils of T1, depending on the position of S2. The output of each secondary winding is fully rectified before being regulated by the individual regulator chips. All supply voltages are placed on the bus at the C.P.U. board. VDS powers all LEDs and display segments. The +5 VDC powers all TTL components on the C.P.U. and driver boards. The +12 and -12 VDC are delivered to the dual input cards and any analog output cards that are inserted, and regulated to required levels on those boards. The V+ supply is only responsible for powering the Model 21501 electronics package at sensor site.

### 5.0 CALIBRATION

#### 5.1 Dual Input Board: This board should never require adjustments. Perform the following procedure only when a data error indication is displayed for a particular site even when a proper sensor signal is input. Refer to Assembly Drawing M404493-003.

- a) Connect the sensor signal cable to site #1 (J1 and J2). Make sure the Skyvane's propeller is stationary for the duration of this calibration. Allow 1/2 hour warm-up time for the electronics package.
- b) Adjust R4 until a 700 Hz signal is observed at pin 1 of U1. If a frequency other than 700 Hz is observed check calibration of skyvane and sensor electronics.
- c) Next, connect the signal cable to site #2. Adjust R5 until a 700 Hz signal is observed at pin 1 of U7.

#### 5.2 Analog Output Board: Calibrate this board only if the observed analog output differs from what is expected from display indications. Remember that display mode may be different from output mode. Refer to Assembly Drawing M404492-003:

- a) Remove W1 and W2 and set the display to INST mode.

NOTE: Analog output voltages may instantaneously vary above the limits indicated below. Ignore slight variations as long as the average indication is within the limits.

- b) Apply a 700 Hz signal (simulating 0 mph wind) to the input board of any site number, making sure that a  $0.1\mu\text{f}$  capacitor couples the + input with the signal generator. Also make sure the display that drives the questionable analog output board is set to display that site. Switch display off.
- c) Switch display on, and within 20 seconds, adjust R5 so that  $0.00 \pm .002$  VDC appears on the speed output. Switch display off again.
- d) Switch display on and within 20 seconds adjust R6 until  $0.000 \pm .002$  VDC appears on the direction output.
- e) After one minute raise the frequency to 900 Hz (simulating 200 mph wind) and adjust R4 so that the speed output is  $1.000 \pm .002$  VDC.
- f) Raise the frequency to 1470 Hz, (simulating a west wind) and adjust R8 for a  $0.500 \pm .002$  VDC direction output.

## 6.0 MAINTENANCE

- 6.1 The wind reporter is designed for minimal maintenance. Wipe the display with a damp cloth whenever necessary. Please refer to maintenance of the sensor and platform electronics at sensor site for appropriate maintenance of these devices.

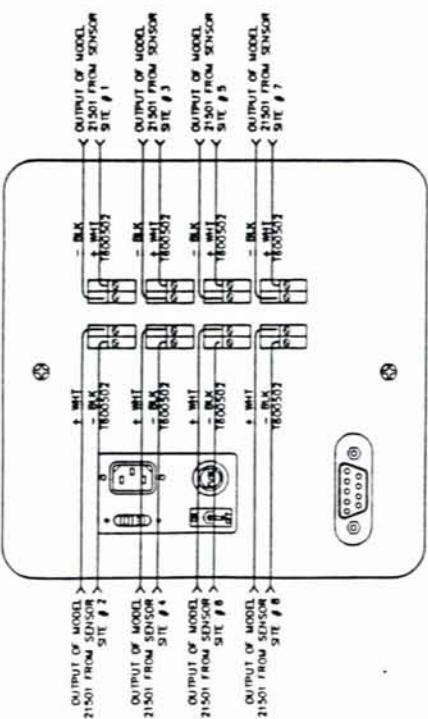

## 7.0 SCHEMATICS AND PARTS LISTS

- 7.1 The following pages include schematics, assembly drawings, and parts list for this instrument. Please note that the parts lists are arranged in assembly/sub-assembly form. Each sub-assembly is on its own page. Sub-assemblies and parts are listed in the smallest economical size available from Qualimetrics.

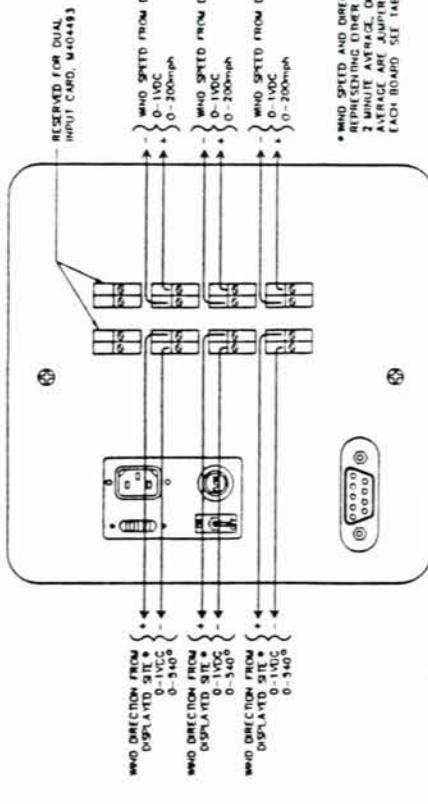

## 8.0 WARRANTY

- 8.1 All instruments are warranted for one year, unless otherwise specified, against defects in material or workmanship. Should any instrument prove to be defective within the warranty period, upon written notice and return of the instrument freight prepaid, Qualimetrics will, at its option, repair or replace the defective unit and

return it freight collect. Instruments used or installed,  
and modified or altered by others, may cancel warranty.
